Experiment No: 2

Title: Tic Tac Toe game implementation by Magic Square Method

Objective: To write a computer program in such a way that computer wins most of the time using Magic Square Method

Theory:

A player who places his coins first across the same row or same column or same diagonal wins the game. Let us take a magic square of order 3 x 3 (for 3 coins game). The sum of the numbers across rows, columns and diagonals are the same - it is 15. That is, a player who places his coins such that he gets the perfect score of 15 takes the prize.

- 1) Board is considered to be a magic square of size 3 X 3 with 9 blocks numbered by numbers indicated by the magic square.
- 2) This representation makes the process of checking for a possible win simpler.
Board Layout as magic square. Each row, column and diagonals add to 15.

8	3	4	15
1	5	9	15
6	7	2	15

- 3) Maintain the list of each player's blocks in which he has played.
Consider each pair of blocks that the player owns.
Compute difference D between 15 and the sum of the two blocks.

If $D < 0$ or $D > 9$ then

i) These two blocks are not collinear and so can be ignored.

9

ii) Otherwise, if the block representing difference is blank (i.e., not in either list) then a move in that block will produce a win.

Post Lab Assignment:

1. What is the relationship between tic-tac-toe and magic square?
2. What is a magic square of order n ?

2. No. No.

Post Lab Assignment : Exp: 2

Q.1] What is the relationship between tic-tac-toe and magic square?

⇒

1. Tic-Tac-Toe and magic square are related through the arrangement of the game board.
2. In Tic-Tac-Toe players aim to create winning combinations of their marks in rows, columns or diagonals.
3. A magic square is a grid where the sum of numbers in each row, column and diagonal is the same.
4. The numbers in a magic square can represent positions on the Tic-Tac-Toe grid.
5. By using the numbers of a magic square, we can easily identify winning combinations in Tic-Tac-Toe.

Q.2] What is a magic square of order n ?

⇒

1. A magic square is a square grid containing numbers arranged in a way that each row, column and diagonal adds up to the same constant sum.
2. The order of a magic square refers to the number of rows and columns it has.
3. For a magic square of order n , it contains n rows and n columns.
4. The numbers used in a magic square of order n range from 1 to n^2 .
5. The sum of each row, column and diagonal in a magic square of order n is called the magic constant, denoted by M .

Formula for calculating the magic constant (M) of a magic square of order n :

$$M = \frac{n(n^2+1)}{2}$$

Where $M \rightarrow$ Magic Constant
 $n \rightarrow$ order of magic square
