#### **Department of Computer Engineering**

T.E. (Computer Sem VI) Assignment -1 Artificial Intelligence (CSC604)

Student Name: Madhav Jha Roll No: 9543

CO Addressed:—CSC604.1 -To conceptualize the basic ideas and techniques underlying the design of intelligent systems.

#### **Assignment 1:**

- 1. Explain the concept of rationality in the context of intelligent agents. How does rationality relate to the behavior of agents in their environments? Provide examples to illustrate your explanation.
- 2. Discuss the nature of environments in which intelligent agents operate. What are the key characteristics that define an environment, and how do they influence the design and behavior of agents? Provide examples of different types of environments and the challenges they present to agents.
- 3. Describe the structure of intelligent agents and the types of agents commonly used in artificial intelligence. What are the components of an agent, and how do they interact to achieve intelligent behavior? Provide examples of different types of agents and their applications in real-world scenarios.
- 4. Outline the process of problem-solving by searching, including the role of problem-solving agents and the formulation of problems. How do problem-solving agents analyze and approach problems, and what methods do they use to search for solutions? Illustrate your explanation with examples of problem-solving tasks and the strategies employed by agents to solve them.

#### **Rubrics for the First Assignments:**

Indicator	Average	Good	Excellent	Marks
Organization (2)	Readable with some missing points and structured (1)	Readable with improved points coverage and structured (1)	Very well written and fully structured	
Level of content(4)	All major topics are covered, the information is accurate (2)	Most major and some minor criteria are included. Information is accurate (3)	All major and minor criteria are covered and are accurate (4)	
Depth and breadth of discussion and representation(4)	Minor points/information maybe missing and representation isminimal (1)	Discussion focused on some points and covers themadequately (2)	Information is presented indepth and is accurate (4)

\$	Rationality in the content of intelligent agents refers
	to the ability of an agent to make decisions tho
	maximize its expected utility or achieve its agents
	goals given the available information and resource
	A rational agent is one that consistently chooses
	the best action or sequence of actions from
	among the available options to achieve its
	Rationality is closely related to the behavior of o
	in their environments in the sense that rational
	agents will adapt their behavior based on feedbac
	From their environment to improve their decision-mot
	process and achieve better outcomes. This adaption
	may involves learning from past experiences
	updating beliefs based on new information and
	adjusting strategies to better align with goals
	Examples:
	1. Checs-playing PI: In the same of checs on AI
	agent can be considered national if it selects
	mare that maximize its chances of winning the
	same. The agent evaluates the potential outcomes
	of different moves based on its knowledge
	of the game rules and board positions
	and then selects the move that loads to
	the most favorable outcome.
	Solf-driving Core: A soft-driving our can be consi

cational if it navigates safely and officiently to its destination while obeying traffic jams patterns, and pedestrian movements, to make real-time decisions about speed, lane changes and navigation routes 8-21 1. Parapt: Do environment provides perceptual input to the agent which includes apy information the agent can obtain through its sensors. The nature and quality of perceptual input significantly offed the agent's ability to perceive and understand its surroundings arrurately. 2. Actions: Agents interact with their environments by executing actions. The set of possible actions an agent can take depends on the environment's dynamics and the agent's capabilities. The diversity and complexity of available actions influence the range of behaviors the agent can 3. State Space: The state space represents all possible configurations of the environment. It encompasses the current state as well as potential future states resulting from agent actions or onvironmental changes. The size and complexity of the state-space impact the agent's decision making process and the effectiveness of its stratergies. 4. Dypanicity: Favironments can be static or dynamic meaning they may or may not change over time. Dynamic environments present challenges such as uncertainty and uppredictability requiring agents to analopt their strategies and decisions in real-time to cope with changes. S. Determinism Ks Stochasticity: Environments can be determinis tic where actions lead to predictable outcomes, or stochastic where outcomes are influenced by random factors. Stochastic

environments introduce uncertainty, making it challenging for agents to reliably predict future states and autroma. 6. Accessibility of Information: Some environments provide agents with complete information about their state and the consequences of actions, while others only offer portial or inamplete information. Limited information can pose challenges for agents, requiring them to make decicions under uncatainity and ambiguity. 7. Spatio-temporal Charaderistics: Environments can have spatial and temporal attributes that influence agent behavior spatial characteristics include dimensions, topology and accessibility, while temporal aspects involve factors such as timing, sequencing and duration of events 8. Multi-agent interactions: In multi-agent environments, agents interact not only with the environment but also with other agents. These interactions introduce competition challenges For orgent. Enomples: 1. Ches: Ches is deterministic of ally observable environment with a discrete state space and a limited set of actions. This challenge for agents lies in exploring the voist state space to anticipate apponents moves and desire winning Strategies 2. Hock market: The stock market is a dynamic statueth environment with partial observable information. Agente must analyze market trends, news and economic indices to make informed decisions about buying selling or holding stacks amidst uncertain and volatility.

JUHU VERSOVA LINK ROAD, VERSOVA, ANDHERI (WEST), MUMBAI - 53.

Structure of Intelligent agents: In terceptual Component: This component enables the agent to perceive its environment through scasous capturing relevant information for instance, in autonomuse vehicles comoras, lidor and radar serva as seasons copturing data about the vehicless surroundings. 2. Knowledge Base: The agent possesses a knowledge base or memory where it stores information about the environment post experiences, and learned behaviors. In virtual personal assistante tike sin or Alexa. the knowledge base includes user preferences post interactions and relevant information retrieved from the evel 3- Decision Making Component: This component processes perceptual impact and knowledge to make decisions and selections In healthcare diagonneis systems, this component analy 20 patient symptoms. Medical history, and knowledge about diseases to recommend treatment plans. 4- Action Component & Based on decisions made the agent executes actions in the environment through actualous of of fectors. Types of itstelligent byents: 1. Reactive Agents: These agents respond directly to environmental stimuli without maintaining an internal state or memory An example is a simple abstacle-avoidance robot that navigates toy sensory input. 9. Deliberative Agents: These agents employ internal models of the environment, reasoning and planning to make decisions. An example is a chee-playing AI that evalute possible

moves and plans on expected outcomes.

Q. No.	No.	
		3. Learning Agents: The agents improve their performance
		over time through learning from experience. Examples
		by trial and error
		4. Hybrid Agents: These agents combine characteristics of
		multiple types leveraging reactive deliberative and learning approaches as needed.
	-	
	8.4	@ Role of Problem-Solving agents:
		1. Troblem-solving agents identify and solve problems to achieve their goals.
		2. They analyze the current state, goal state, and
		possible actions to reach the goal.
		3. Hablem-salving agents employ various search algorithm
_		to explore the space of possible solutions efficiently.
		(B) formulation on trablems:
		goal state actions and constraints.
		2. This formulation provides a structural representation
		of the problem, enabling agents to analy se and
		solve it systematically.
		(C) Analyzing and Approaching Problems"-
		to Problem-solving agents analyze the problem space to understand its structure and possible solutions.
		2. They employ heuristics domain knowledge, and
		problem-specific strategies to guide the search proces
		effectively.
		3. Agents may decompose complex problems into smaller
		subproblems to ensier resolution.
		1 Methods Used for Scorching Solutions:
	-	1. Uninformed Search: Agents explore the problem space
		g stematically without considering domain-specific
		Koowledge.
		2. Informed Search: Agents use domain-sprific knowledge
		or heuristics to guide the search towards promising

solutions.
Ex: A*Search, greedy best first Search
3. Local Search: Agents iteratively improve candidate
solutions by making small modifications.
Fx. Hill climbing, simulated appealing.
(E) Thus tradive Framples:
1. Kouting Planning: In pavigation systems, problem-
solving agents search for the shortest path between
two locations on a map
2. Pozzle solving: In games like sudoku or Kubritis
Cube organis aim to find solutions satisfying certain
Constraints.
3. Automoded Planning: In robotics or automoded
systems, problem-solving agents plan sequences
of actions to achieve desired outcomes.
